SECTION 4

CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 DUPLEXER CIRCUIT

The transceiver has a duplexer (low-pass and high-pass filters) on the first stage from the antenna connector to separate the signals into VHF and UHF signals. The low-pass filter (L1–L3, C30, C31) is for VHF signals and high-pass filter (L100, L101, C345–C347) is for UHF signals. The separated signals are applied to each RF circuit.

4-1-2 VHF ANTENNA SWITCHING CIRCUIT

The antenna switching circuit functions as a low-pass filter while receiving. However, its impedance becomes very high while transmitting by applying a current to D30 and D31. Thus, transmit signals are blocked from entering the receiver circuits. The passed signals are then applied to the RF amplifier circuit.

4-1-3 VHF RF CIRCUIT

The RF circuit amplifies signals within the range of frequency coverage and filters out-of-band signals.

The signals from the antenna switching circuit are applied to the RF pre-amplifier (Q50) and are then applied to the bandpass filter (L47, L156, C170, C761, C762) via the RF attenuator circuit (D33). The filtered signals are applied to the RF amplifier (Q51) and are then applied to another bandpass filter (D36, D38, D40). The filtered signals are then applied to the RF mixer circuit (Q52).

D36, D38 and D40 track the bandpass filters and are controlled by the PLL lock voltage. These diodes tune the center frequency to obtain good image response rejection.

4-1-4 VHF RF ATTENUATOR CIRCUIT

The current flow of the RF attenuator circuit (D33) is controlled by the [SQL] control via the D/A control IC (IC19). When the [SQL] control rotated past the center, the current of D33 is increased. In this case, D33 acts as an attenuator.

4-1-5 1ST MIXER AND 1ST IF CIRCUITS

The mixer circuit converts the received signals to a fixed frequency of the 1st IF signal with a 1st LO (VCO output) frequency. By changing the PLL frequency, only the desired frequency will be passed through a pair of crystal filters at the next stage of the mixer.

The received signals from the VHF RF circuit are mixed with the 1st LO signal (VCO output signal) at the 1st mixer (Q52) to produce a 45.05 MHz 1st IF signal.

The 1st IF signal is applied to a pair of crystal filter (FI2) to suppress out-of-band signals. The filtered 1st IF signal is amplified at the 1st IF amplifier (Q60) and is then applied to the 2nd mixer circuit (IC20).

4-1-6 VHF RECEIVING VIA UHF DISPLAY

The transceiver has additional VHF RF and mixer circuits for a V/V para-watch function.

Some of the RF signals from the RF pre-amplifier (Q50) are applied to the V/V RF amplifier (Q75) via the attenuator circuit (D65) and bandpass filter (D66). The amplified signals are mixed with a 1st LO signal at the mixer circuit (Q76) to produce an 57.65 MHz IF signal. The signal is then applied to the UHF IF circuit (IC23 described in section 4-1-11).

The VHF VCO circuit (Q113, Q114) in the UHF PLL circuit generates the 1st LO signal for the V/V para-watch function.

4-1-7 2ND IF AND DEMODULATOR CIRCUITS

The 2nd mixer circuit converts the 1st IF signal to a 2nd IF signal. A double superheterodyne system (which converts received signals twice) improves the image rejection ratio and obtains stable receiver gain.

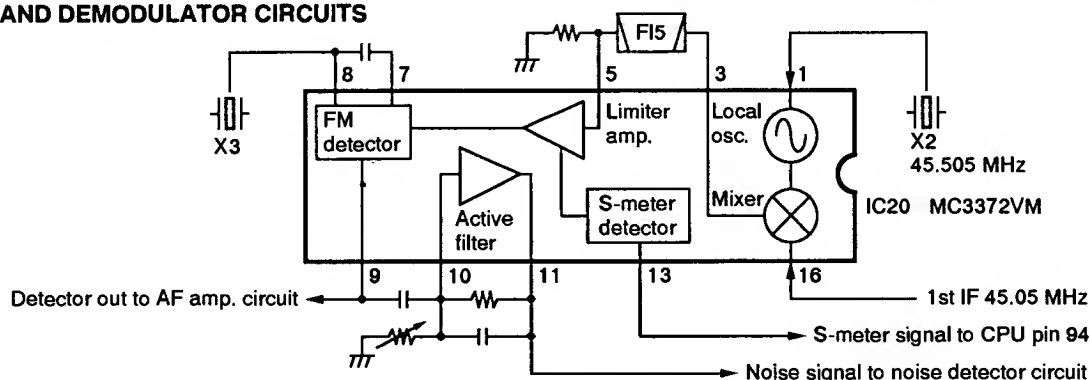

The FM IF IC (IC20) contains the 2nd local oscillator, 2nd mixer, limiter amplifier, noise amplifier, S-meter detector and quadrature detector circuits, etc.

The 1st IF signal (45.05 MHz) from the 1st IF amplifier (Q60) is applied to the 2nd mixer section of IC20 (pin 16), and is mixed with the 2nd LO signal (45.505 MHz) for conversion to a 455 kHz 2nd IF signal at the 2nd mixer section.

The 2nd IF signal (455 kHz) from the 2nd mixer section (IC20 pin 3) passes through the ceramic filter (FI5) where unwanted signals are suppressed. It is then amplified at the limiter amplifier section (IC20 pin 5) and applied to the quadrature detector section (IC20 pin 8 and discriminator X5) to demodulate the 2nd IF signal into AF signals.

AF signals output from IC20 (pin 9) are applied to the AF amplifier circuit via the AF selector (IC22).

2ND MIXER AND DEMODULATOR CIRCUITS

4-1-8 AF AMPLIFIER CIRCUIT

The AF amplifier circuit amplifies the detected signals to drive a speaker. For the separate speaker function, a stereo power amplifier is used.

AF signals are passed through the AF switch (Q158), then the AF selector (IC22 pins 10, 11). AF signals from IC22 (pin 11) are applied to the active filter (Q163, Q164) which functions as a high-pass filter to suppress subaudible tone signals for tone squelch operation.

The filtered signals pass through the volume control IC (IC18) and are then applied to the AF power amplifier (IC15 pin 2). The output signals are applied to an external speaker jack (J2) via the "SPA" line. When no plug is connected to the jack, the signals are fed back to the UHF audio input (IC19 pin 5) and combined with the UHF audio. The mixed audio is applied to the other external speaker jack (J1) and then to the internal speaker.

4-1-9 VHF NOISE SQUELCH CIRCUIT

A noise squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signal, the squelch circuit switches the AF mute switches.

Some of the noise components in the AF signals from IC20 (pin 9) are passed through the active filter section (IC20 pins 10, 11), and then applied to the noise detector circuit (Q197, D121). The variable resistor (R398) adjusts the input level of the active filter, and the level is used for squelch threshold reference. The detected noise signals are applied to the CPU (IC29 pin 95) via the "VSQL S" line.

The [VHF SQL] (CONTROL unit R38) controls the input level of the sub-CPU (CONTROL unit IC2 pin 6) in DC voltage. The sub-CPU reads the angle of the [VHF SQL] rotation, then send the squelch data to the CPU incorporated in the RDATA. The squelch level is also controlled from the HM-98; the CPU receives squelch data from the HM-98 via the MDATA line.

The applied signals from the noise detector circuit and the CONTROL unit or from the HM-98 are differentiated by the CPU, and then the CPU controls AF mute switches (IC16, Q191) via the "VA MUTE" line.

4-1-10 UHF RF CIRCUIT

The signals from the UHF antenna switching circuit (D75-D77, D90) are applied to the RF pre-amplifier (Q85) and are then applied to the RF amplifier (Q86) via the RF attenuator circuit (D78). The amplified signals are passed through the bandpass filter (FI4), then applied to the 1st mixer circuit.

4-1-11 UHF 1ST MIXER AND 1ST IF CIRCUITS

The amplified signals from the RF amplifier (Q86) are mixed with a 1st LO signal at the mixer circuit (Q87) to produce a 57.65 MHz 1st IF signal. The 1st LO signal is the PLL output which comes from the U-UHF VCO circuit (Q123, D107, D145). The 1st IF signal is passed through a pair of crystal filters (FI3) to suppress out-of-band signals and then amplified at the IF amplifier (Q78).

4-1-12 UHF RECEIVING VIA VHF DISPLAY

The transceiver has additional UHF RF and mixer circuits for a U/U para-watch function.

Some of the RF signals from the RF pre-amplifier (Q85) are applied to the U/U RF amplifier (Q57) via the attenuator circuit (D45). The amplified signals are mixed with a 1st LO signal at the mixer circuit (Q58) to produce an 45.05 MHz IF signal via the bandpass filter (FI1). The signal is then applied to the UHF IF circuit (IC20 described in section 4-1-5).

The UHF VCO circuit (Q33) in the VHF PLL circuit generates the 1st LO signal for the U/U para-watch function.

4-1-13 UHF 2ND IF AND DETECTOR CIRCUITS

The IC23 incorporates the 2nd mixer, 2nd local oscillator, limiter amplifier, noise amplifier, quadrature detector and S-meter detector circuits. The 2nd local oscillator section and X4 generate 57.195 MHz for the 2nd LO signal.

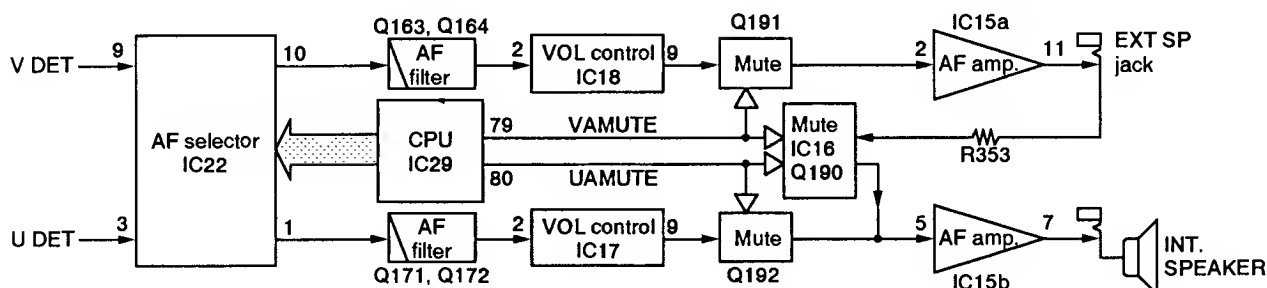

The amplified 1st IF signal is fed to the FM IF IC (IC23 pin 16) where the signal is converted into a 2nd IF signal, then AF signals.

The AF signals output from IC23 (pin 9) pass through the AF switch (Q168), AF selector (IC22 pins 2, 1) and then active filters (Q171, Q172).

4-1-14 UHF NOISE SQUELCH CIRCUIT

A portion of the AF signals from IC23 (pin 9) are passed through the noise amplifier (IC23 pins 10, 11) and detected at Q167 and D123. The detected noise signals are applied to the CPU via the "USQL S" line, for reference. Then the CPU controls AF mute switches (IC16, Q190, Q192) after being differentiated by the squelch level setting.

AF SIGNAL LINE

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT

The microphone amplifier circuit amplifies audio signals from the microphone to a level needed for the modulation circuit. The microphone amplifier circuit is commonly used for the both VHF and UHF bands.

The AF signals from the microphone are applied to the MIC mute switch (Q178) and then amplified at the Q175. Then the amplified signals are applied to the IDC limiter amplifier (IC25b pin 5). The output signals from the IDC limiter amplifier (IC25b pin 7) are passed through the splatter filter (IC25a pins 3, 1) and then applied to each VCO circuit as a "MOD" signal via the deviation adjustment pot.

4-2-2 VHF MODULATION CIRCUIT

The modulation circuit modulates the oscillating signal (RF signal) using the microphone audio signals.

The "MOD" signal changes the reactance of a diode (D15) to modulate the oscillated signal at the VHF-VCO circuit (Q18, Q19). The VCO output is buffer-amplified at Q17, Q16 and Q15, and is then applied to the transmit/receive switching circuit (D41, D149) via the low-pass filter (L20, C75, C76).

4-2-3 VHF DRIVE AMPLIFIER CIRCUIT

The drive amplifier circuit amplifies the VCO oscillated signal to the needed level at the power amplifier.

The signal from the transmit/receive switching circuit (D149) is passed through the " π " type attenuator circuit (R24–R26) and then amplified at the pre-drive amplifier (Q11). The amplified signal is amplified again at the drive amplifier (Q10) to obtain approx. 26 dBm.

4-2-4 VHF POWER AMPLIFIER CIRCUIT

IC4 is a power module which provides more than 50 W of output power with a 13.8 V DC power source.

An RF signal from the drive amplifier (Q10) is applied to IC4 (pin 1). The amplified signal from the power amplifier (IC4 pin 4) is then applied to the antenna connector via the transmit/receive switching circuit (D5) and low-pass filter.

4-2-5 VHF APC CIRCUIT

The APC circuit protects the power module (IC4) and drive amplifier (Q10) from a mismatched output load and stabilizes transmit output power.

The APC detector circuit (D7 and D6) detects forward signals and rectified signals respectively. The combined voltage is at a minimum level when the antenna is matched at 50 Ω and increases when it is mismatched. The combined voltage is applied to the APC amplifier (IC7) and compared with a reference voltage which is supplied from the D/A control IC (IC19 pin 14).

The output voltage from IC7 (pin 4) is applied to the APC control circuit (Q55, Q56) to control the bias voltage of the PA module (IC9) and drive amplifier (Q10).

4-2-6 UHF MODULATION CIRCUIT

The audio signals from the microphone amplifier circuit (described in Section 4-2-1) are applied to the UHF-VCO circuit.

The audio signals change the reactance of a diode (D107) to modulate the oscillated signal at the UHF-VCO circuit (Q123, D145). The oscillated signal is amplified at the buffer amplifiers (Q120–Q122) and is then applied the LO switch circuit (D105, D148).

4-2-7 UHF POWER AMPLIFIER CIRCUIT

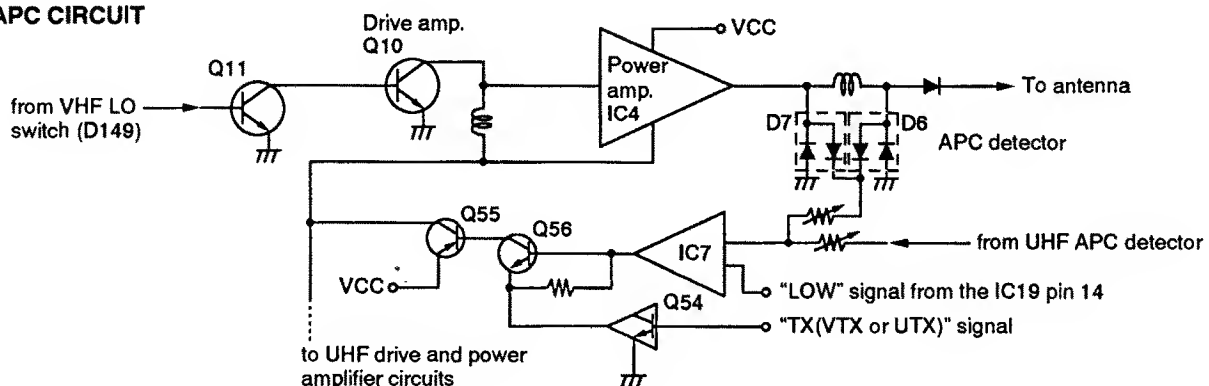

IC11 is a power module which provides a stable 35 W (at 13.8 V DC) of output power.

The pre-drive (Q106, Q107), drive amplifier (Q105) and power amplifier (IC11) amplify the VCO oscillating signal to an output level. The output signal passes through the APC detector circuit (D91, D92) and bandpass filter, and is applied to the antenna connector.

4-2-8 UHF APC CIRCUIT

The APC detector circuit (D92 and D91) detects the forward and rectified signals, respectively. IC7 compares the voltages detected by the APC detector with the reference voltages. When the detected voltage exceeds a reference voltage, IC7 reduces the bias current of IC11 (pin 4) using Q56 and Q55 to decrease the RF output power.

A PLL circuit provides stable oscillation of the transmit frequency and the receive local frequency. The PLL circuit compares the phase of the divided VCO frequency to the reference frequency. The PLL output frequency is controlled by a crystal oscillator and the divided ratio of the programmable divider.

4-3-2 VHF PLL CIRCUITS

V-VHF LOOP

The generated signal at the V-VHF VCO (Q18, Q19) is amplified at the buffer-amplifiers (Q17, Q40) and then applied to the PLL IC (IC6 pin 19). The applied signal is divided by serial data from the CPU and phase-detected with the divided reference frequency. The phase difference is output as pulses.

The output signal from IC6 (pin 13) is converted to DC voltages (lock voltage) by the active loop filter (Q41–Q43) and then fed back to the V-VHF VCO circuit to stabilize the VCO frequency.

The lock voltage is also used for the receiver circuit for tracking the bandpass filter center frequency. The lock voltage from Q42 is amplified at the buffer-amplifier (Q35) and then applied to the VHF RF circuit.

V-UHF LOOP

This loop is used for UHF receiver in VHF display while the U/U para-watch function is activated.

The generated signal at the V-UHF VCO (Q33) is amplified at the buffer-amplifiers (Q32, Q40) and then applied to the PLL IC (IC6 pin 19). The applied signals are divided by serial data from the CPU and phase-detected with the divided reference frequency. The phase difference is output as pulses.

The output signal from IC6 (pin 13) is converted to DC voltages (lock voltage) by the active loop filter (Q41–Q43) and then fed back to the V-UHF VCO circuit to stabilize the VCO frequency.

4-3-3 UHF PLL CIRCUITS

U-UHF LOOP

The generated signal at the U-UHF VCO (Q123) is amplified at the buffer-amplifiers (Q122, Q130) and then applied to the PLL IC (IC12 pin 19). The applied signals are divided by serial data from the CPU and phase-detected with the divided reference frequency. The phase difference is output as pulses.

The output signal from IC12 (pin 13) is converted to DC voltages (lock voltage) by the active loop filter (Q131–Q133) and then fed back to the U-UHF VCO circuit to stabilize the VCO frequency.

U-VHF LOOP

This loop is used for VHF receiver in UHF display while the V/V para-watch function is activated.

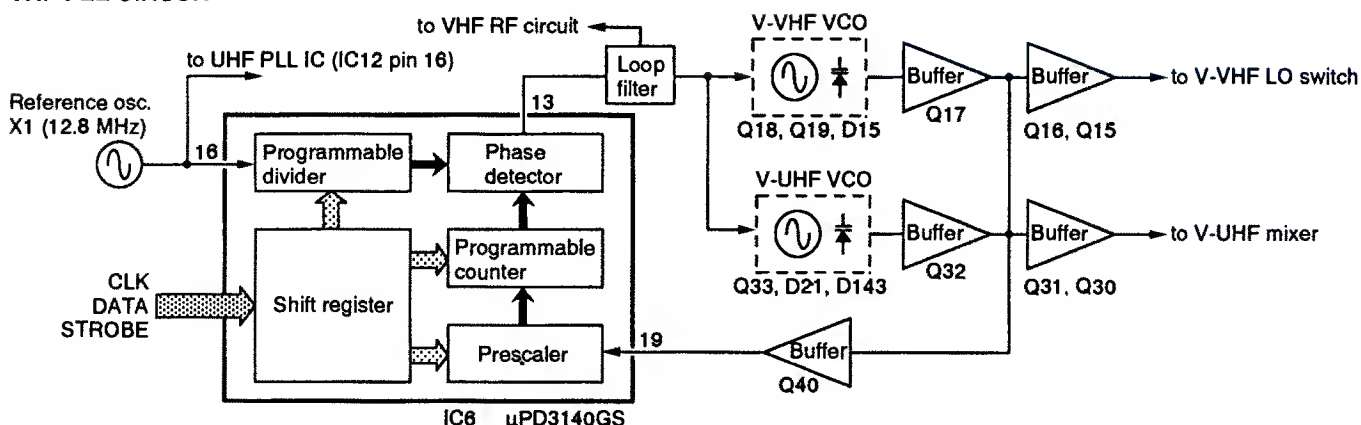

The generated signal at the U-VHF VCO (Q113, Q114) is amplified at the buffer-amplifiers (Q112, Q130) and then applied to the PLL IC (IC12 pin 19). The applied signals are divided by serial data from the CPU and phase-detected with the divided reference frequency. The phase difference is output as pulses.

The output signal from IC12 (pin 13) is converted to DC voltages (lock voltage) by the active loop filter (Q131–Q133) and then fed back to the U-VHF VCO circuit to stabilize the VCO frequency.

The lock voltage is also used for the receiver circuit for tracking the bandpass filter center frequency. The lock voltage from Q132 is amplified at buffer amplifiers (Q140) and then applied to the VHF circuit.
